SCHED meeting, June 2 2017, 9.30

present Des, eBob, Arpad
via telephone Mark

eBob: swiggify neeeds dynamically linked libraries. Enter f2py, which creates a module to interface to fortran. This is a project withing numpy. There is no access to fortran parameters, but this is no show-stopper

Des: investigated flags, there is not really one. Only at the lowest level a check is made whether things are already set, which means it is ok as long as you actually set all of them. However, all the checks are made regardlessly.

Mark: still has to set up git. Found free name for Github organisation jive-vlbi.

eBob: start creating translation layer between fortran data structures and python objects

Des: provide overview of station info to eBob

next meeting: June 21, 11.00
