

JUC meeting, February 13, 11.00. Arpad's room

present: Jonathan, Harro, Des, Arpad

Jonathan: each FN seems to receive a few strange packets at the beginning, with wrong timestamp. Non-repeatable, only at start, very few. System is now robust against such events. Run of 60 scans went ok, nothing broke.

Quick look at data: phase offset UB – SFXC. However, no slope with time? Good. Will test with sine wave, try to recover knows phase, see who is right.

New data set has been recorded during eVLBI, strong calibrators. Need to be converted to VDIF.
