WURM, 1-10-2018

present Aard, Wybren, Ilse, Paul, eBob, Harro, Arpad

Mark has leave, Des has a sick child

Arpad: Des told him he is working on aligning the frequency bands in the KVN data

Aard: has merged the de-dispersion code, now SFXC hangs sometimes. Need to find the bug. Once that is done, merge phased array mode, which should be a lot easier.

Wybren: this morning out was dead. Reboot, runs again. Try to break it tomorrow. Going to make a machine for Alexander. Going to use flexbuff 12 for tests of network interface cards and migration of jop83. Firmware upgrade of cards should help (told by some Surfnet person)

Ilse: EVN symposium with tutorial coming up, JJ review, EHT telecons. Many papers need to be out before February, in order to get time with ALMA

Paul: last issues CDR, consortium does not exist anymore. Poster + talk for TOG and EVN, talk for Geneve. Today hand some WR stuff to Astron guys. Need to add some more info to power outage instructions.

eBob: working on log2vex. Adding the possibility to set IPS for JUC people.

Harro: worked with Bert on clockthingy. Did some re-writing, now actually works with E3 and new plotting tools, kind of useful and correct. Working on jplotter, comparing different implementations for speed. Presentation for TOG
