

WURM, 14/10/2019, 14.00

present Mark, Paul, Harro, Des, eBob, Arpad

Mark: ADASS last week. Gave a talk at IVOA. It seems there will be a special interest group for radio astronomy in the VO. Decided against attending Saturday as well, long week. George is here until Wednesday. Tomorrow eVLBI, pay attention to performance, see if problem recur. Last e the correlator started to run behind, this is not you understood. Only different thing was 16000 channels, which is more than usual. Tomorrow 18 stations, max bw.

Paul: E3 and out have been moved, old out is out. Mark6 has been ordered, after 2 weeks at inkoop. Trantor root disks have been replaced. Found some very old non-automated backups of Marco Polo on Trantor, unclear what to do with it. SFXC 2nd tranche nodes now on new Ubuntu. Proposal tool is being migrated, needs testing. eBob asks about backups. Paul will ask.

Harro: ADASS. Need to prepare 3 presentations. Some issues with jiveplt (response after presentation). Need development E3, to run CWL, docker and other escape-related stuff. Cluster of Sipior (is in the States) or new hardware locally? VM not really a good idea.

Des: ADASS, now working with George.

eBob: Wb problem during e, different bit masks, more bitstreams than expected. Wrong on both sides, fixed our side (first bitmask, then framesize), but Wb is setting bitmask every scan. Drudge error? Keep an eye on it. For the rest, pySCHED. Is being used by support scientists.
