Present Harro, Mark, eBob, Paul, Arpad

Harro: spent quite some time on ADASS, also busy with m5spec and vdfspec. Quite a mess, quite a lot of work needed. Unclear whether this is something we should be doing. Maybe ask Uwe what they use at Ef? Need to write something for EVN newsletter, start presentation for ADASS (vacation coming up). Simon Casey and Guifre both had some problems, in one case problem with scanset, other case problem with misconfiguring of DBBC3.

Mark: EOP code done, but wrong. Sophie had filled the NFS disk, which gave problems. Michael wants to use k-nodes to pipeline new EHT data release. Need to run it by dr Bob

eBob: converting setini files into frequency catalogs, told support scientists, they should now be able to do a lot without waiting for dr Bob. Moving Fortran code to Python

Paul: tested surfnet8. Ordering 100G equipment. Calculated EB070 phase centers (all two of them). Link issue still not solved, but making progress. Reinoud on vacation, no decision on Northstar yet. Disk broken in Flexbuff2, replaced with replacement disk that just came in. Made space on jop83 and fixed Aips. How about turning off EEE? Waiting for Mark. Ccsbeta is off. Backups remain a problem, put in a ticket to ZFS and Ubuntu.
