

BHC e-VLBI meeting, November 9 2015, 11.30, Arpad's room

present Harro, eBob, Arpad

eBob has made a simple script to try breaking stuff. When connection is broken, no error code is generated. This is a bit of a problem. When a transfer is finished, it is basically impossible to ask for the status.

The number of bytes to transfer are of course known in advance, so if the counters are stored what has been sent can be compared to what should have been sent. With flexbuff – flexbuff transfer, chunks are counted. Bookkeeping should be built in. This bookkeeping is doable, and actually very useful, and so will be built in.

In the mean time, test machine at JIVE is still not open to outside world, and Paul will be gone next two weeks. Use Aribox instead. eBob will send email tot Uwe, session is finished, ask access to Ef equipment. First install software on Aribox.
