

JUC meeting, 9/4/2-15, 11.00, Arpad's room

present Jonathan, Harro, Des, Arpad

EG87A has been re-converted, re-correlated. (minus 3 scans that had only 3 stations anyway). Being j2ms2'd, but already clear that there are lots of zero weights. Need to fix and redo.

Harro broke E3, fixed by Paul.

32MHz version is being tested, a new product table will be needed at some point.

SFXC: ridiculously slow from flexbuff (factor 10 compared to JUC). Nobody knows if something is being done about this, Arpad will talk to Aard (and has done so by now).

JIVE Council in 1.5 week, need some pictures. Phase UB + phase SFXC + diff phase can be made now, images of calibrator will have to wait for re-correlation.
