

JUC meeting, 17-04-2014, Arpad's room

present: Harro, Des, Jonathan, Salvatore, Arpad

Jon: bug in subbands B&C has probably been fixed. Matter of 4 state machines which should be identical, but of which had blanked out lines. Last known bug is more frequent now, namely one or more of the BN not sending out data at times. Signal taps put in, shows that all data should be there. Suspicion is that there is a glitch on the application reset line. Software reset gated with power reset, cannot be glitch on power reset or many more problems. Investigating, maybe remove app reset?

Guifre: on vacation

Des: made tool for Guifre to generate vex block, should eliminate mix ups of bands etc and make Guifre's life a lot easier

Salvatore: working on doc for read side, nearly done. Validity + write side done, checked by Jon. FB, coeff. generation may need documentation as well, Jon and Salvatore will go through design and see where additional docs are needed.
