

JUC, 22-6-2017, 14.00

present Harro, Des, Jonathan, Benito, Arpad

Des: talked to eBob about mods needed in runjob. No clear date. Des to remind eBob, produce within 2 weeks

Harro has made a local hacked edition which solves problems with sending UDP, ignores ICMP messages, not for outside use.

Formatter test was done with simulator, failed. Everything looks fine after cornerturning, unfortunately the UB does not like any of the data because of all reasons. Suspicious. However, old data are still accepted by UB. Need investigation obviously.

Jonathan: still some problems with 64MHz personality. FFT: some labeling changes are needed in JSON (to be done by Des), but not solution of problem. Has an idea, scaling problem between branches.

Benito: just came back from whatever, no time to do anything about imaging yet. Data was deleted by dr Bob. Now have to look for new candidate for imaging. Reducing global right now, might be some 64MHz data, preserve some.

Harro: Gino tells him cornerturning + sending to diff. addresses works, as long as data packets \leq 2000B. Did not know. Now needs testing.

Des will work towards formatter test with system as is, first simulated data, then try to find 2 friendly stations.
