WURM(pje), 2-1-2018, 14.00

present Des, eBob, Mark, Paul, Arpad

Des: finally got a new version of Casa to work. Now will check his FF stuff into the development branch, then hand over to NRAO. JUC: should fix the model calculation before the next e, can be done offline.

eBob: looking at the Euoprean data protection thingy, for Northstar. According to dr. Bob it should be enough to be able to remove users from database. Now making script to do so. Sched: new versification script for python modules. Looking at plotting, Qt +matplotlib/ Mainly reverse engineering, looking at what it does rather than the code.
Walter and Cormac have not responded, promised to do some stuff... better wait until half January or so

Mark: will help Des clean up the code. Wants a VEX2 schedule of eBob to run through the parser, correlate a scan. Has EHT data, 3 stations, one of which is ALMA, will need fixing the code.

Paul: talked to Eskild at Jb, making 3 times 1G lightpath into 1. On suggestion of Surfnet, try to make a new 3G lightpath, then migrate. Google has warned about lots of 404 responses, missing pages. Seems to have to do with changes Aukelien made, will be back on Thursday. For SaDT, working on documentation, trying to plot error bars in Adev plots, too small, not visible. On the 18th readiness review, after that another month of fiddling with docs, then all goes to reviewers.
